

# AOIs extraction in SVGs

## Project Plan

Charbel ABOU KHEIR, Jean Paul AL AM, Arsène MALLET, Marie-José TANNOURY, Alain TRAD.

*Under the supervision of Anne-Flore Cabouat.*

## Presentation and discussion

This project's goal is to extract and visualize the Area of Interests (AOIs) of heterogeneous SVG files (Scalable Vector Graphics). The SVGs we are working on are already data visualizations, and have a somewhat shared structure (legends, labels, axis, ETC.).

Given what we understood and the discussions we had with our supervisor, the task here is not to build a data model, or using machine learning techniques to make statistical AOI recognition (furthermore, given the small dataset we're given to work on, it would've been difficult), but rather to use deterministic methods and algorithms to parse, semantically analyze and build a structured representation of the AOIs in a given SVG, such as a tree structure.

After getting a working extraction, the goal of the project is also to provide the appropriate "pipeline" and visualization tooling to works with the extraction algorithm(s) efficiently.

## Schedule

## **Roles**

The following is an initial breakdown of the roles we have assigned ourselves for the project. The goal of this allocation is to ensure clear ownership and accountability for every aspect of the project. However, these roles remain flexible and may be adjusted as the project evolves.

- **C. ABOU KHEIR:**
- **J-P. AL AM:**
- **A. MALLET:**
- **M-J. TANNOURY:**
- **A. TRAD:**
